

IN THE CLAIMS

Please amend claims 1, 7-8, and 13-20 as follows below.

Please add new claims 22-41 as follow below.

The following listing of claims replaces all prior versions, and listings, of claims in the application:

MARKED UP VERSION OF CLAIMS

- 1           1.     (Currently Amended)   A method comprising:  
2           generating a measure of global functional activity in  
3           an integrated circuit;  
4           determining if a predetermined limit of global  
5           functional activity in [[an]] the integrated circuit has  
6           been met or exceeded;  
7           and if so, then  
8           gradually reducing a high frequency of clocking of  
9           circuitry ~~gradually~~ to zero to stop the clocking of  
10          circuitry,  
11          waiting a predetermined time after stopping the  
12          clocking of circuitry, and  
13          starting the clocking of circuitry at a low frequency.
  
- 1           2.     (Original)   The method of claim 1, wherein  
2           if the determining if the predetermined limit of global  
3           functional activity in the integrated circuit has not been

4 met or exceeded, it is repeated.

1        3.    (Original)    The method of claim 1, wherein  
2        the predetermined time is a number of clock cycles of a  
3        free-running clock of the integrated circuit.

1        4.    (Currently Amended)    The method of claim 1 wherein,  
2        the gradual reducing of the high frequency clocking of  
3        circuitry ~~gradually~~ to zero includes  
4                clocking circuitry at a first frequency, and,  
5                before clocking the circuitry at a second  
6                frequency lower than the first frequency,  
7                waiting a predetermined time during the  
8                clocking of the circuitry at the first frequency.

1        5.    (Original)    The method of claim 1, wherein,  
2        after starting the clocking of the circuitry at the low  
3        frequency, the method further includes  
4                gradually increasing the frequency of the  
5                clocking of the circuitry to the high frequency.

1        6.    (Original)    The method of claim 5 wherein,  
2        the gradual increasing of the frequency of the clocking  
3        of circuitry to the high frequency includes  
4                clocking circuitry at a first frequency, and,  
5                before clocking the circuitry at a second

6 frequency higher than the first frequency,  
7 waiting a predetermined time during the  
8 clocking of the circuitry at the first frequency.

1 7. (Currently Amended) The method of claim 1,  
2 wherein,  
3 an estimated temperature level of the integrated  
4 circuit is proportional to the global functional activity in  
5 the integrated circuit ~~is proportional to temperature of the~~  
6 ~~integrated circuit~~ and  
7 the predetermined limit of global functional activity  
8 is proportional to an expected temperature level of the  
9 integrated circuit.

1 8. (Currently Amended) The method of claim 1,  
2 wherein  
3 the gradual reducing of the high frequency clocking of  
4 the circuitry ~~gradually~~ to zero avoids large variations in  
5 current otherwise associated with a rapid shut-off of the  
6 clocking of circuitry.

1 9. (Original) The method of claim 5, wherein  
2 the starting of the clocking of the circuitry at the  
3 low frequency and the gradual increase in the frequency of  
4 the clocking of the circuitry to the high frequency avoids  
5 large variations in current otherwise associated with a

6 rapid turn-on of the clocking of circuitry.

1 10. (Original) An integrated circuit comprising:  
2 a clock generator to generate a clock;  
3 an activity detector to measure global functional  
4 activity of the integrated circuit; and  
5 a clock throttling controller coupled to the activity  
6 detector and the clock generator, the clock throttling  
7 controller to generate a throttled clock to couple to  
8 functional blocks of the integrated circuit for clocking  
9 circuitry therein, the clock throttling controller to  
10 gradually throttle the frequency of the throttled clock to  
11 the functional blocks in response to the measure of the  
12 global functional activity meeting or exceeding a  
13 predetermined limit.

1 11. (Original) The integrated circuit of claim 10,  
2 wherein,  
3 the activity detector receives measures of local  
4 functional activity associated with each functional block of  
5 the integrated circuit to measure the global functional  
6 activity of the integrated circuit.

1 12. (Original) The integrated circuit of claim 10,  
2 wherein,  
3 the activity detector receives measures of local

4 functional activity associated with each functional block of  
5 the integrated circuit to determine the measure of the  
6 global functional activity of the integrated circuit,  
7 the activity detector compares the measure of the  
8 global functional activity with the predetermined limit to  
9 determine if it is met or exceeded, and  
10 the activity detector signals to the clock throttling  
11 controller whether or not the predetermined limit has been  
12 met or exceeded.

1 13. (Currently Amended) The integrated circuit of  
2 claim 10, further comprising,  
3 a logical gate coupled to the clock generator and the  
4 clock throttling controller, the logical gate to receive the  
5 clock from the clock generator and ~~the clock throttling~~  
6 ~~controller to receive~~ a control signal from the clock  
7 throttling controller, the logical gate to periodically mask  
8 out one or more clock cycles of the clock to generate the  
9 throttled clock in response to the control signal, to  
10 gradually throttle down the frequency of the throttled clock.

1 14. (Currently Amended) The integrated circuit of  
2 claim 13, wherein,  
3 the logical gate is an AND gate to logically AND the  
4 clock and the control signal from the clock throttling  
5 controller together to periodically mask out the one or more

6 clock cycles of the clock in response to the control signal  
7 and generate the throttled clock.

1 15. (Currently Amended) The integrated circuit of  
2 claim 10, wherein,  
3 one hundred percent of [[the]] circuitry in the  
4 functional blocks can have the throttled clock stopped.

1 16. (Currently Amended) The integrated circuit of  
2 claim 10, wherein,  
3 less than one hundred percent of [[the]] circuitry in  
4 the functional blocks can have the throttled clock stopped.

1 17. (Currently Amended) The integrated circuit of  
2 claim 16, wherein,  
3 only [[the]] circuitry to which the throttled clock can  
4 be stopped is the throttled clock coupled and its frequency  
5 gradually throttled in response to the measure of the  
6 functional activity meeting or exceeding the predetermined  
7 limit.

1 18. (Currently Amended) The integrated circuit of  
2 claim 10, wherein,  
3 the frequency of the throttled clock is gradually  
4 throttled OFF ~~and then ON~~ in response to the measure of the  
5 functional activity meeting or exceeding the predetermined

6    limit and  
7       after being OFF for a predetermined period of time, the  
8    throttled clock is then gradually throttled ON.

1       19. (Currently Amended) A clock generator comprising:  
2       a free-running clock generator to generate a free-  
3    running clock;  
4       an a-thermal activity detector to receive measures of  
5    local functional activity associated with each functional  
6    block of an integrated circuit and generate a total measure  
7    of functional activity of the in-an integrated circuit, the  
8    activity detector [[and]] to determine whether or not the  
9    total measure of functional activity meets or exceeds a  
10   ~~thermal~~ predetermined limit of activity to generate an  
11   enable ~~thermal~~ throttling signal; and  
12       a clock throttling controller coupled to the ~~thermal~~  
13   activity detector and the free-running clock generator, the  
14   clock throttling controller to generate a throttled clock to  
15   couple to the functional blocks of the integrated circuit  
16   for clocking circuitry therein, the clock throttling  
17   controller to gradually throttle the frequency of the  
18   throttled clock to circuitry of the functional blocks in  
19   response to the enable ~~thermal~~ throttling signal.

1       20. (Currently Amended) A [[The]] clock generator of  
2   ~~claim 19~~ comprising:

3        a free-running clock generator to generate a free-  
4 running clock;

5        a thermal activity detector to generate a total measure  
6 of functional activity in an integrated circuit and to  
7 determine whether or not the total measure of functional  
8 activity meets or exceeds a thermal limit of activity to  
9 generate an enable thermal throttling signal; and

10       a clock throttling controller coupled to the thermal  
11 activity detector and the free-running clock generator, the  
12 clock throttling controller to generate a throttled clock to  
13 couple to functional blocks of the integrated circuit for  
14 clocking circuitry therein, the clock throttling controller  
15 to gradually throttle the frequency of the throttled clock  
16 to circuitry of the functional blocks in response to the  
17 enable thermal throttling signal,

18       wherein [[,]] the clock throttling controller includes  
19 [[,]]

20                a linear feedback shift register connected in  
21                a loop to generate a clock gating control signal,  
22                the clock gating control signal to selectively  
23                mask out clock cycles in the throttled clock to  
24                gradually reduce its frequency and to selectively  
25                insert clock cycles into the throttled clock to  
26                gradually increase its frequency, and

27                a state machine coupled to the linear  
28                feedback shift register to control the selective

29           masking out of clock cycles and the selective  
30           inserting of clock cycles in the throttled clock  
31           to gradually throttle the frequency down to shut  
32           OFF the throttled clock and gradually throttle the  
33           frequency up from being shut OFF in response to  
34           the enable thermal throttling signal.

1           21. (Original) The clock generator of claim 20,  
2    wherein,  
3           the clock throttling controller further includes,  
4           a programmable counter to count a programmable delay  
5    time between changes in frequency of the throttled clock.

1           22. (New) The method of claim 7, wherein,  
2           the expected temperature level of the integrated  
3    circuit is one-hundred twenty five degrees centigrade, a  
4    maximum operating junction temperature for silicon.

1           23. (New) The method of claim 7, wherein,  
2           the expected temperature level of the integrated  
3    circuit is one-hundred ten degrees centigrade, a maximum  
4    case temperature under bias.

1           24. (New) The method of claim 7, wherein,  
2           the expected temperature level of the integrated  
3    circuit is eighty-five degrees centigrade, an operational

4 case temperature.

1 25. (New) The method of claim 7, wherein,  
2 the expected temperature level of the integrated  
3 circuit is seventy degrees centigrade, a maximum ambient air  
4 temperature.

1 26. (New) The method of claim 7, wherein,  
2 the expected temperature level of the integrated  
3 circuit is fifty-five degrees centigrade, a maximum air  
4 temperature.

1 27. (New) The integrated circuit of claim 10, wherein,  
2 the expected limit is proportional to a well known  
3 temperature level for integrated circuits.

1 28. (New) The integrated circuit of claim 27, wherein,  
2 the well known temperature level for integrated  
3 circuits is one-hundred twenty five degrees centigrade, a  
4 maximum operating junction temperature for silicon.

1 29. (New) The integrated circuit of claim 27, wherein,  
2 the well known temperature level for integrated  
3 circuits is one-hundred ten degrees centigrade, a maximum  
4 case temperature under bias.

1           30. (New) The integrated circuit of claim 27, wherein,  
2           the well known temperature level for integrated  
3           circuits is eighty-five degrees centigrade, an operational  
4           case temperature.

1           31. (New) The integrated circuit of claim 27, wherein,  
2           the well known temperature level for integrated  
3           circuits is seventy degrees centigrade, a maximum ambient  
4           air temperature.

1           32. (New) The integrated circuit of claim 27, wherein,  
2           the well known temperature level for integrated  
3           circuits is fifty-five degrees centigrade, a maximum air  
4           temperature.

1           33. (New) The integrated circuit of claim 10, wherein,  
2           the clock throttling controller gradually throttles  
3           down the frequency of the throttled clock to zero in  
4           response to the measure of the global functional activity  
5           meeting or exceeding the predetermined limit.

1           34. (New) The integrated circuit of claim 33, wherein,  
2           after a predetermined period of time with the frequency  
3           of the throttled clock at zero, the clock throttling  
4           controller gradually throttles up the frequency of the

5 throttled clock from zero.

1        35. (New) The clock generator of claim 19, wherein,  
2        the clock throttling controller gradually throttles  
3        down the frequency of the throttled clock to zero in  
4        response to the enable throttling signal.

1        36. (New) The clock generator of claim 35, wherein,  
2        after a predetermined period of time with the frequency  
3        of the throttled clock at zero, the clock throttling  
4        controller gradually throttles up the frequency of the  
5        throttled clock from zero.

1        37. (New) The clock generator of claim 19, wherein,  
2        the predetermined limit is proportional to a well known  
3        temperature level for integrated circuits.

1        38. (New) The clock generator of claim 37, wherein,  
2        the well known temperature level for integrated  
3        circuits is one-hundred ten degrees centigrade, a maximum  
4        case temperature under bias.

1        39. (New) The clock generator of claim 37, wherein,  
2        the well known temperature level for integrated  
3        circuits is eighty-five degrees centigrade, an operational  
4        case temperature.

1           40.   (New)   The clock generator of claim 37, wherein,  
2           the well known temperature level for integrated  
3   circuits is seventy degrees centigrade, a maximum ambient  
4   air temperature.

1           41.   (New)   The clock generator of claim 37, wherein,  
2           the well known temperature level for integrated  
3   circuits is fifty-five degrees centigrade, a maximum air  
4   temperature.
